

### 3.6. Implicit Differentiation

Goal: To differentiate functions that can be implicitly defined where derivative exists.

$f(x) = y = \sqrt{1-x^2}$   $y$  is explicitly defined as a function of  $x$  for  $-1 \leq x \leq 1$

the same function can also be implicitly

defined as:  $y^2 = (\sqrt{1-x^2})^2$

$y$  is still a function of  $x$ .

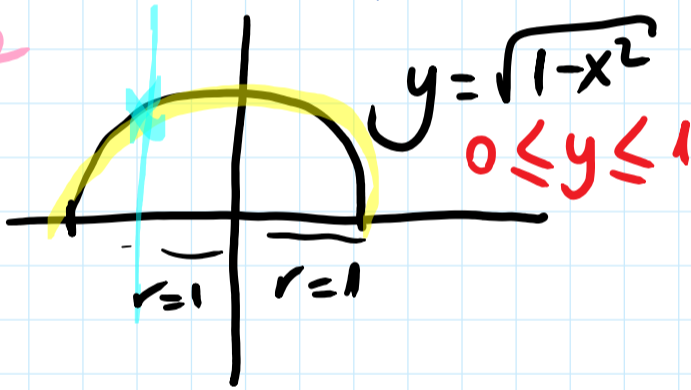

$$y^2 = 1 - x^2$$
$$x^2 + y^2 = 1$$

(eq. of a circle which has a center on the origin, radius of 1)

$$x^2 + y^2 = r^2$$

$$x^2 + y^2 = 1^2$$

# Procedure for Implicit Differentiation

Suppose an equation defines  $y$  implicitly as a differentiable function of  $x$ .

To find  $\frac{dy}{dx}$  ( $y'$ )

Step 1) Differentiate both sides of the equation w/ respect to  $x$ . Remember  $y$  is really a function of  $x$  for part of the curve and use the chain rule when differentiating terms containing  $y$ .

Step 2) Solve the differentiated equation algebraically for  $\frac{dy}{dx}$  ( $y'$ )

Exp)

$$y = \sqrt{1-x^2}$$

$$x^2 + y^2 = 1$$

explicit  $f$  of  $x$

implicitly defined  $f$  of  $x$

$$y = \sqrt{1-x^2}$$

$$y' = (\sqrt{1-x^2})'$$

$$= [(1-x^2)^{\frac{1}{2}}]'$$

$$= \frac{1}{2} (1-x^2)^{\frac{1}{2}-1} \cdot (-2x)$$

$$= \frac{-x}{\sqrt{1-x^2}}$$

$$(x^2 + y^2)' = (1)'$$

$$2x + 2y \cdot y' = 0$$

$$\begin{array}{r} -2x \qquad \qquad \qquad -2x \\ \hline 2y \cdot y' = -2x \\ \hline 2y \qquad \qquad \qquad 2y \end{array}$$

$$y' = \frac{-x}{y}$$

$$y' = \frac{-x}{\sqrt{1-x^2}}$$

We should obtain the same  $y'$ .

Exp) Find  $y'$  for  $x^2 \cdot y^3 - 6 = 5y^3 + x$

is the same as:

$$y = \left( \frac{x+6}{x^2-5} \right)^{1/3}$$

power rule  
quotient rule  
chain rule

Solution:

Step 1:

$$\begin{aligned} x^2 \cdot y^3 - 6 &= 5y^3 + x \\ (x^2 \cdot y^3)' - 6' &= (5y^3)' + (x)' \end{aligned}$$

Diff.  
w respect to  
 $x$ .

$$2x \cdot y^3 + x^2 \cdot (y^3)' = 15y^2 \cdot y' + 1$$

$$2x \cdot y^3 + x^2 \cdot 3y^2 \cdot y' = 15y^2 \cdot y' + 1$$

Step 2:

$$3x^2 y^2 \cdot y' - 15y^2 \cdot y' = 1 - 2x \cdot y^3$$

$$y' \cdot [3x^2 y^2 - 15y^2] = 1 - 2x y^3$$

$$y' = \frac{1 - 2x y^3}{3x^2 y^2 - 15y^2} = \frac{2x y^3 - 1}{15y^2 - 3x^2 y^2}$$

Exp) Find  $y'$  for  $x^2y + 2y^3 = 3x + 2y$

$$(x^2y)' + (2y^3)' = (3x)' + (2y)'$$

$$2x \cdot y + x^2 \cdot y' + 6y^2 \cdot y' = 3 + 2 \cdot y'$$

find  
the derivative  
w/ respect to  
 $x$

$$x^2 \cdot y' + 6y^2 \cdot y' - 2 \cdot y' = 3 - 2xy$$

$$\frac{y'(x^2 + 6y^2 - 2)}{x^2 + 6y^2 - 2} = \frac{3 - 2xy}{x^2 + 6y^2 - 2}$$

$$y' = \frac{3 - 2xy}{x^2 + 6y^2 - 2}$$

Exp) Find the slope of the tangent line to the curve  $x^2 + y^2 = 25$  at  $P(-3, 4)$

Solution:

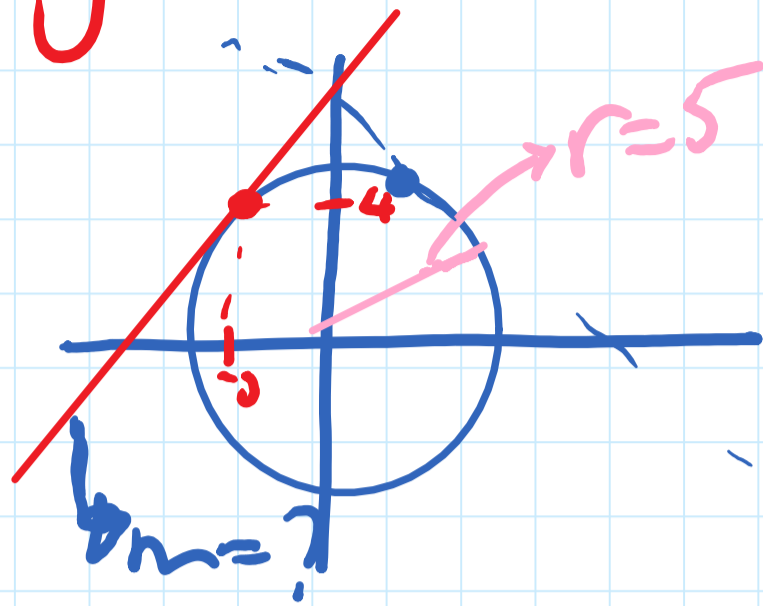

$$(x^2 + y^2)' = (25)'$$

$$2x + 2y \cdot y' = 0$$

$$\begin{array}{r} -2x \\ \hline 2y \end{array} \quad \begin{array}{r} -2x \\ \hline 2y \end{array}$$

$$\frac{2y \cdot y'}{2y} = \frac{-2x}{2y}$$

$$y' = \frac{-x}{y}$$

(+) slope  
(-) slope

$$y' \Big|_{(-3, 4)} = \frac{-(-3)}{4} = \frac{3}{4}$$

Exp) What if  $x^2 + y^2 = -1$ ,  $y' = ?$

If we follow the procedure blindly we obtain  $y' = \frac{-x}{y}$ ; however, in the world of real numbers, there're values of  $x$  &  $y$  that makes  $x^2 + y^2 = -1$  a valid statement. Derivative DNE.

Exp) Find  $y'$  for:  $\sin(x^2+y) = y^2 \cdot (3x+1)$

Solution:  $(\sin(x^2+y))' = (y^2 \cdot (3x+1))'$

$$\cos(x^2+y) \cdot (2x+y') = 2y \cdot y' \cdot (3x+1) + y^2 \cdot 3$$

$$2x \cdot \cos(x^2+y) + \cos(x^2+y) \cdot y' = 2y \cdot y' \cdot 3x + 2y \cdot y' + 3y^2$$

$$2x \cdot \cos(x^2+y) - 3y^2 = 6xy \cdot y' + 2y \cdot y' - \cos(x^2+y) \cdot y'$$

$$\underline{2x \cdot \cos(x^2+y) - 3y^2} = y' \cdot \underline{(6xy + 2y - \cos(x^2+y))}$$

$$y' = \frac{2x \cdot \cos(x^2+y) - 3y^2}{6xy + 2y - \cos(x^2+y)}$$

Ex) Find  $y''$  when  $x^2 + y^2 = 10$

Solution:

$$(x^2 + y^2)' = 10'$$

$$\begin{array}{r} 2x + 2y \cdot y' = 0 \\ -2x \qquad \qquad \qquad -2x \end{array}$$

$$\frac{2y \cdot y'}{2y} = \frac{-2x}{2y} \Rightarrow y' = \frac{-x}{y}$$

$$y'' = (y')' \Rightarrow y'' = \left(\frac{-x}{y}\right)'$$

$$y'' = \frac{-1 \cdot y - (-x) \cdot y'}{y^2}$$

$$y'' = \frac{-y + x \cdot y'}{y^2}$$

$$y'' = \frac{-y + x \cdot \left(\frac{-x}{y}\right)}{y^2} = \frac{-y - \frac{x^2}{y}}{y^2}$$

$$= \frac{-y^2 - x^2}{y^3} = \frac{-x^2 - y^2}{y^3}$$

$$= \frac{-(x^2 + y^2)}{y^3} = \frac{-10}{y^3} = y''$$

Given

$$x^2 + y^2 = 10$$

Exp) Show that  $(x^n)' = n \cdot x^{n-1}$ ,  $x > 0$

Solution:

$$y = x^n$$

$$\ln y = \ln x^n$$

$$[\ln x^n = n \cdot \ln x]$$

$$(\ln y)' = (\ln x^n)'$$

$$(\ln y)' = (n \cdot \ln x)'$$

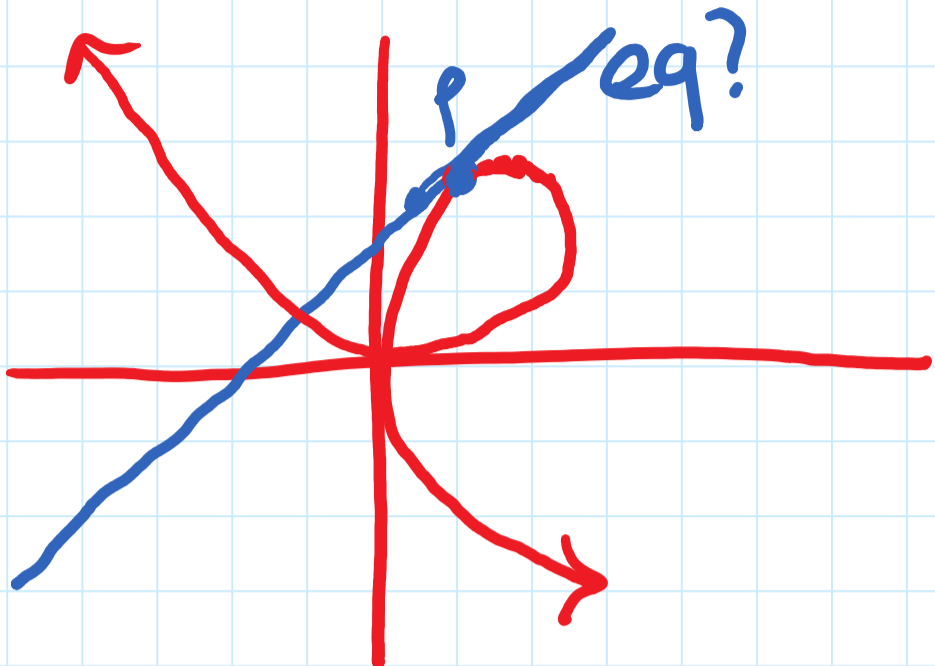

$$y \cdot y' = n \cdot \frac{1}{x} \cdot y$$

$$y' = n \cdot \frac{1}{x} \cdot y$$

$$y' = n \cdot \frac{1}{x} \cdot x^n$$

$$y' = n \cdot x^{n-1}$$

Exp) Find an equation of the tangent line to  $x^3 + y^3 = 3xy$  at  $P\left(\frac{2}{3}, \frac{4}{3}\right)$

$$(x^3 + y^3)' = (3xy)'$$

$$3x^2 + 3y^2 \cdot y' = 3 \cdot y + 3x \cdot y'$$

$$3x^2 - 3y = 3xy' - 3y^2 \cdot y'$$

$$3(x^2 - y) = 3y'(x - y^2)$$

$$y' = \frac{x^2 - y}{x - y^2}$$

$$y' \Big|_{\left(\frac{2}{3}, \frac{4}{3}\right)} = \frac{\left(\frac{2}{3}\right)^2 - \frac{4}{3}}{\frac{2}{3} - \left(\frac{4}{3}\right)^2} = \frac{\frac{4}{9} - \frac{4}{3}}{\frac{2}{3} - \frac{16}{9}}$$

$$y' \Big|_{\left(\frac{2}{3}, \frac{4}{3}\right)} = \frac{\frac{4}{9} - \frac{12}{9}}{\frac{6}{9} - \frac{16}{9}} = \frac{\frac{4-12}{9}}{\frac{6-16}{9}} = \frac{-8}{-10} = \frac{8}{10}$$

$$y - \frac{4}{3} = \frac{8}{10} \left(x - \frac{2}{3}\right)$$

The eq. of the tangent line to the curve at point P.

Exp) find  $y'$  for  $f(x) = x^x$

Solution:

$$y = x^x$$

$$\ln y = \ln x^x$$

$$\ln y = x \cdot \ln x$$

$$\text{then } y' \Rightarrow (\ln y)' = (x \cdot \ln x)'$$

$$y \cdot \frac{y'}{y} = \left( 1 \cdot \ln x + x \cdot \frac{1}{x} \right) \cdot y$$

$$y' = (\ln x + 1) \cdot y$$

$$y' = (\ln x + 1) \cdot x^x$$

Given  
 $y = x^x$

(Use logarithmic differentiation)

Exp)

$$y = (1 + \sin(2x))^{x^2}$$

find  $\frac{dy}{dx}$  ( $y'$ )

Solution:

Use logarithmic differentiation

$$\ln y = \ln (1 + \sin(2x))^{x^2}$$

$$\ln y = x^2 \cdot \ln(1 + \sin(2x))$$

$$\frac{dy/dx}{y} = 2x \cdot \ln(1 + \sin(2x)) + x^2 \cdot \frac{(1 + \sin(2x))'}{1 + \sin(2x)}$$

$$y \cdot \frac{dy/dx}{y} = \left( 2x \cdot \ln(1 + \sin(2x)) + \frac{x^2 \cdot 2 \cdot \cos 2x}{1 + \sin 2x} \right) \cdot y$$

$$\frac{dy}{dx} = \left( 2x \cdot \ln(1 + \sin(2x)) + \frac{x^2 \cdot \cos 2x}{1 + \sin 2x} \right) \cdot (1 + \sin(2x))^{x^2}$$

Exp) find  $y'$  for  $\sin(x+y) = x + \cos y$

$$(\sin(x+y))' = (x + \cos y)'$$

$$\cos(x+y) \cdot (x+y)' = 1 - \sin y \cdot y'$$

$$\cos(x+y) \cdot (1+y') = 1 - \sin y \cdot y'$$

$$\cos(x+y) + \cos(x+y) \cdot y' = 1 - \sin y \cdot y'$$

$$\cos(x+y) \cdot y' + \sin y \cdot y' = 1 - \cos(x+y)$$

$$y' \cdot (\cos(x+y) + \sin y) = 1 - \cos(x+y)$$

$$y' = \frac{1 - \cos(x+y)}{\cos(x+y) + \sin y}$$
